We use the integers a, b, and n to create the following series:

$$(a+2^0 \cdot b), (a+2^0 \cdot b+2^1 \cdot b), \ldots, (a+2^0 \cdot b+2^1 \cdot b+\ldots+2^{n-1} \cdot b)$$

You are given q queries in the form of a, b, and n. For each query, print the series corresponding to the given a, b, and n values as a single line of n space-separated integers.

Input Format

The first line contains an integer, q, denoting the number of queries.

Each line i of the q subsequent lines contains three space-separated integers describing the respective a_i , b_i , and n_i values for that query.

Constraints

- $0 \le q \le 500$
- $0 \le a, b \le 50$
- 1 < n < 15

Output Format

For each query, print the corresponding series on a new line. Each series must be printed in order as a single line of n space-separated integers.

Sample Input

2 0 2 10 5 3 5

Sample Output

2 6 14 30 62 126 254 510 1022 2046 8 14 26 50 98

Explanation

We have two queries:

- 1. We use a=0, b=2, and n=10 to produce some series s_0,s_1,\ldots,s_{n-1} :
 - $s_0 = 0 + 1 \cdot 2 = 2$
 - $s_1 = 0 + 1 \cdot 2 + 2 \cdot 2 = 6$
 - $s_2 = 0 + 1 \cdot 2 + 2 \cdot 2 + 4 \cdot 2 = 14$

... and so on.

Once we hit n=10, we print the first ten terms as a single line of space-separated integers.

2. We use a=5, b=3, and n=5 to produce some series s_0,s_1,\ldots,s_{n-1} :

•
$$s_0 = 5 + 1 \cdot 3 = 8$$

•
$$s_1 = 5 + 1 \cdot 3 + 2 \cdot 3 = 14$$

•
$$s_2 = 5 + 1 \cdot 3 + 2 \cdot 3 + 4 \cdot 3 = 26$$

•
$$s_3 = 5 + 1 \cdot 3 + 2 \cdot 3 + 4 \cdot 3 + 8 \cdot 3 = 50$$

•
$$s_4 = 5 + 1 \cdot 3 + 2 \cdot 3 + 4 \cdot 3 + 8 \cdot 3 + 16 \cdot 3 = 98$$

We then print each element of our series as a single line of space-separated values.
