Exception handling is the process of responding to the occurrence, during computation, of exceptions – anomalous or exceptional conditions requiring special processing – often changing the normal flow of program execution. (Wikipedia)

Java has built-in mechanism to handle exceptions. Using the *try* statement we can test a block of code for errors. The *catch* block contains the code that says what to do if exception occurs.

This problem will test your knowledge on try-catch block.

You will be given two integers x and y as input, you have to compute x/y. If x and y are not x0 bit signed integers or if x0 is zero, exception will occur and you have to report it. Read sample Input/Output to know what to report in case of exceptions.

# Sample Input 0:

```
10
3
```

# **Sample Output 0:**

3

# **Sample Input 1:**

```
10
Hello
```

## **Sample Output 1:**

```
java.util.InputMismatchException
```

#### Sample Input 2:

```
10
0
```

# **Sample Output 2:**

```
java.lang.ArithmeticException: / by zero
```

# Sample Input 3:
